INTRODUCTION

The Federal Water Pollution Control Act of 1972 (FWPCA) and subsequent Amendments in 1977, 1981 and 1987 are collectively known as the Clean Water Act (CWA). The objective of this statute is to restore and maintain the chemical, physical, and biological integrity of the Nation's waters. As one step toward meeting this goal each state must administer a program to monitor and assess the quality of its surface and groundwater and provide periodic status reports to the U.S. Environmental Protection Agency (EPA), the U.S. Congress, and the public. Section 305(b) of the CWA codifies the process whereby waters are evaluated with respect to their capacity to support designated uses as defined in each of the states' surface water quality standards. These uses include aquatic life support, fish and shellfish consumption, drinking water supply, and primary (e.g., swimming) and secondary (e.g., boating) contact-recreation. The 305(b) process entails assessing each of these uses for rivers, lakes and coastal waters. Where possible, causes and sources of use impairment are also identified.

Section 303(d) of the CWA and the implementing regulations at 40 CFR 130.7 require states to identify those waterbodies that are not expected to meet surface water quality standards after the implementation of technology-based controls and to prioritize and schedule them for the development of a total maximum daily load (TMDL). A TMDL establishes the maximum amount of a pollutant that may be introduced into a waterbody and still ensure attainment and maintenance of water quality standards. Furthermore, a TMDL must also allocate that acceptable pollutant load among all potential sources. The formulation of the 303(d) List includes a more rigorous public review and comment process than does reporting under Section 305(b), and the final version of the list must be formally approved by the EPA.

Prior to 2002 states prepared and submitted to the EPA both a biennial *Summary of Water Quality Report* in accordance with the requirements of Section 305(b) as well as a separate Section 303(d) *List of Impaired Waters*. On November 19, 2001 the EPA released guidance for the preparation of an optional *Integrated List of Waters* that would combine reporting elements of both sections 305(b) and 303(d) of the CWA. The integrated listing format allows states to provide the status of all their assessed waters in a single, multi-part list.

States choosing this option can list each waterbody or segment thereof in one of the following five categories:

- 1) Unimpaired and not threatened for all designated uses;
- 2) Unimpaired for some uses and not assessed for others;
- 3) Insufficient information to make assessments for any uses;
- 4) Impaired or threatened for one or more uses, but not requiring the calculation of a Total Maximum Daily Load (TMDL); or
- 5) Impaired or threatened for one or more uses and requiring a TMDL.

Thus, waters listed in Category 5 constitute the 303(d) List and, as such, are to be reviewed and approved by the EPA. The remaining four categories are submitted in fulfillment of the requirements under Section 305(b), essentially replacing the old 305(b) Report format. Massachusetts formulated integrated lists in accordance with EPA guidance for the 2002, 2004 and 2006 listing cycles. The EPA subsequently approved each of these. Final versions of the 2004 and 2006 lists and related information, such as public comment documents and EPA approval letters, can be accessed at <http://mass.gov/dep/water/resources/tmdl.htm>.

In a memorandum to the EPA's regional Water Division Directors dated October 12, 2006, Diane Regas, Director of the Office of Wetlands, Oceans and Watersheds, recommended that states follow the *Guidance for 2006 Assessment, Listing and Reporting Requirements Pursuant to Sections 303(d), 305(b) and 314 of the Clean Water Act* when preparing their 2008 integrated water quality reports. Using the EPA's guidance, and the format developed for previous listing cycles, Massachusetts' 2008 Integrated List was compiled.

This report presents the individual categories of Massachusetts' waters for the 2008 CWA listing cycle along with pertinent supporting documentation. The introductory sections pertaining to the water resources of Massachusetts, costs and benefits of clean water, and the water quality management programs were taken directly from the 2006 Report with little revision.

WATER RESOURCES OF MASSACHUSETTS

Information in this section was derived primarily from Gadoury and Wandle (1986) and Strause (1991). The Commonwealth of Massachusetts ranks 45th out of the 50 states in surface area (approx. 7,840 sq mi), yet its 6,349,097 inhabitants place it 13th in population (US Census Bureau, 2000). More than 75 percent of the population resides in the eastern one-third of the state.

Massachusetts encompasses two geological provinces: the Coastal Plain and the New England Upland. Cape Cod and the Islands form the coastal plain and consist of low hills and plains covering unconsolidated sediments that form the most productive aquifers in the State. The New England Upland province consists of till and stratified drift above metamorphic and igneous rocks, and provides small productive aquifers. Groundwater is used for water supply in small communities and almost exclusively on Cape Cod and the Islands. Surface water is the major source of water supply for all the major urban areas in the state, since no other source is capable of meeting these demands. Surface water in the state is relatively plentiful and of high quality, but it is not distributed in proportion to the distribution of the population. Two thirds of Massachusetts' residents depend upon surface water for their needs. The Massachusetts Water Resources Authority (formerly Metropolitan District Commission) supplies communities in the Greater Boston area (about half the state usage of surface water) from Quabbin and Wachusett reservoirs in the central uplands.

Annual precipitation averages about 45 inches and is fairly evenly distributed throughout the state. Average annual evaporation of free water surfaces ranges from about 26 inches in Western Massachusetts to about 28 inches in the eastern half of the State. Yearly runoff ranges from about 20 inches in Cape Cod to about 32 inches in the northwestern corner of the State. The lowest runoff generally occurs during July, August and September. Runoff is highest in March in the eastern sections of the state and April in the western sections and at higher elevations.

Massachusetts incorporates all or a portion of nine major drainage systems – Hudson, Housatonic, Connecticut, Thames, Narragansett Bay, Mount Hope Bay, Boston Harbor, Merrimack and Coastal – that, in turn, are made up of a total of 32 smaller watersheds or drainage areas. These have been regrouped slightly to create the 27 watersheds, or drainage areas, that serve as the fundamental planning units of the Massachusetts' monitoring, assessment and management programs. They are described in more detail later in this report. A summary of some general surface water resource statistics for Massachusetts is provided in the table that follows.

COSTS AND BENEFITS OF CLEAN WATER

The benefits to society of clean water can hardly be over-stated. Adequate supplies of clean water are essential to the survival and propagation of fish, shellfish and other aquatic life, as well as terrestrial wildlife and humans that rely on these organisms for food. Furthermore, man's dependence on clean water for domestic, industrial and recreational purposes is placing ever-increasing demands on limited water supplies. While the value to society of maintaining clean water is intuitive and fairly easily understood in a qualitative sense, a comprehensive economic analysis of the benefits of clean water can be far-reaching and complex. Sometimes it is useful to turn the question around: "What is the cost to society, in terms of public health, economics or other factors, of NOT achieving sound water quality conditions?"

An analysis such as this typically involves comparing the costs of maintaining or restoring water quality with the socioeconomic benefits realized when the desired water quality condition is achieved. In a strict sense, this "cost-benefit analysis" has an underlying premise that a threshold exists beyond which the cost to attain the use may exceed the benefit gained, but this most certainly has implications for resources such as air and water that are absolutely essential to life on this planet. And, whereas it is possible to assign monetary costs to the construction and operation of water and wastewater treatment facilities or other activities aimed at restoring water quality, it is often more difficult to predict the value of the benefit gained from achieving water quality goals. Typically, these gains are measured by indicators such as increases in the number of fishing licenses sold, decreases in the number of shellfish bed or beach closures, or increases in property values associated with good quality waters. The aesthetic value placed on clean water, on the other hand, is more difficult to measure economically and may vary considerably from one person to the next. Another significant factor limiting the utility of this kind of analysis is the lack of data and information pertaining to the impacts of water pollution on public health and the economy. For example, the incidence of water-borne illnesses associated with swimming in contaminated waters goes largely unreported, making the resultant savings in health costs, to say nothing of human suffering, associated with the cleanup of those waters difficult to estimate.

A complete assessment of the socioeconomic costs and benefits associated with restoring and maintaining the integrity of Massachusetts' waters is beyond the scope of this report. Nonetheless, a few examples of the financial commitments made to the protection and restoration of water resources, and the value of selected enterprises relying on those resources, can serve to illustrate the magnitude of the socioeconomic affects of clean water. One major financial commitment enabled by passage of the Clean Water Act is the funding of wastewater collection and treatment infrastructure. Details pertaining to the State Revolving Fund (SRF) can be found later in this report. This program, and its predecessor Construction Grants Program, represent the largest single financial commitment to clean water in Massachusetts and are estimated to be approximately \$7 billion from 1968 to the present. Over and above the initial capital outlay for construction is the annual operational costs incurred by municipalities that maintain and operate

treatment works. In addition, since 1999 the SRF has provided almost one billion dollars in loans for the treatment and distribution of municipal water supplies.

The construction grant and loan programs are by no means the only sources of capital used to ensure clean water. Private industries and institutions pay for the installation and operation of wastewater treatment and pre-treatment facilities. Furthermore, water and wastewater infrastructure will not do the job alone. For example, the management of nonpoint sources of pollution is best accomplished through the implementation of best management practices (BMPs) and responsible landuse, so resources are needed to increase public awareness and stewardship. The CWA Section 319 addresses the identification and management of nonpoint sources of pollution and provides grant monies for the implementation of BMPs and public education programs. Almost \$25 million in Section 319 grants were awarded in Massachusetts between 1990 and 2005. Many other agencies, as well as non-governmental organizations (NGOs), such as private institutions, watershed associations and citizen environmental advocacy groups, commit time and financial support to educating the public and promoting behaviors that will lead to cleaner waters in Massachusetts. It is difficult, however, to put a price tag on all of this good work.

As stated earlier, it is even more challenging to estimate the magnitude of the economic benefit associated with clean water than it is the costs of achieving clean water. Economic benefits from clean water in Massachusetts are reflected in data and information on sport and commercial fisheries, recreation in and on the water, tourism, and property values. The following statistics may help to illustrate the extent of these benefits, but they are by no means comprehensive or complete. The US Fish and Wildlife Service and US Census Bureau report that 615,000 recreational anglers fished a total of 7.7 million days in Massachusetts in 2001. Associated expenditures were \$465 million dollars. This includes food, lodging, transportation, fishing gear and associated equipment, licenses and fees, etc. The Massachusetts Division of Marine Fisheries (MADMF) estimates that in 2004 the number of salt-water recreational anglers in Massachusetts exceeded one million and that these men and women spent approximately \$1 billion on their sport.

According to the National Oceanic and Atmospheric Administration (NOAA), Massachusetts' commercial fishery ex-vessel revenues in 2003 totaled \$292.5 million, placing it first among ten northeast coastal states. Because most finfish and shellfish species that comprise this commercial catch rely on near-shore waters and river estuaries for all or a portion of their lifecycles, the quality of freshwaters and their watersheds has a direct effect on the health of the offshore fishery. Reductions in ground stocks of commercially valuable fishes have been documented in the waters off New England for several years now, and this serious problem is likely attributed to a combination of environmental degradation, over-fishing and other factors that are difficult to quantify. Therefore, it is difficult to predict with certainty the direct monetary benefits to the commercial fishery from various steps taken to achieve clean water in Massachusetts' watersheds and coastal waters. Nonetheless, it stands to reason that a recovery in Massachusetts' marine fisheries cannot be accomplished if clean water is not restored and maintained in those near-shore waters.

The Massachusetts tourism industry brought in \$12.46 billion in direct spending in 2004 that generated \$808 million in state and local taxes. It is assumed that two-thirds of this travel was for leisure and that a substantial number of tourists were involved with water-related activities such as swimming, boating, fishing and viewing wildlife. Furthermore, much of Massachusetts' cultural history centers on its waterways that provided food and transportation to its' endemic people and early settlers and hydropower and navigation during the industrial revolution. The aesthetic value of these waters and associated sites of interest is enhanced immeasurably by clean water. Again, although not quantified here, it is evident that the Massachusetts travel industry benefits directly from clean water and that ongoing pollution abatement will result in further economic gains for tourism. Finally, several studies have concluded that clean water has a positive effect on adjacent property values. For example, a study in Maine demonstrated that lakefront properties were up to \$200 higher per frontage foot when water quality was good. Similarly, others have shown that water clarity is essential to the enjoyment of lakes and ponds and that people are willing to pay to ensure that clean water is maintained.

In summary, a detailed analysis of the socioeconomic benefit of clean water to Massachusetts' residents would be complex and time-consuming and would be better undertaken as a separate study. Nonetheless, from the examples presented, it should be evident that the restoration and maintenance of clean water, while not inexpensive, result in enormous benefit to the economy and quality of life in Massachusetts.

KEY ELEMENTS OF THE MASSACHUSETTS WATER QUALITY MANAGEMENT PROGRAM

Watershed-based Monitoring, Assessment and Implementation

Massachusetts has adopted a watershed approach to planning and implementing water resource protection activities throughout the state. The quality of Massachusetts' surface waters is influenced not only by the natural ecology, hydrology, and geomorphology of the land area they drain, but also by the mosaic of land-use patterns resulting from man's activities within their respective drainage basins or watersheds. Thus, pollutants originating at remote locations in a watershed have the capacity to adversely impact water quality for considerable distances downstream. For example, the deleterious effects of contaminants, such as suspended solids or essential plant nutrients, that are released to surface waters within the watershed, either directly from wastewater treatment facilities (point sources) or as the result of being washed off the land with stormwater (nonpoint sources), may not be fully realized until they reach sensitive waterbodies, such as lakes, impoundments or estuaries. There they contribute to habitat alteration, the proliferation of algae and other aquatic vegetation, and other water quality problems. From this it is readily apparent that effective water quality management of the waters in Massachusetts is largely dependent upon the prevention and control of pollution throughout their watersheds. Watershed protection has become the dominant theme of many state water quality management programs and the EPA has endorsed this approach by providing financial and technical support for its implementation. The result is a comprehensive, integrated program that addresses all aspects of water resource management, such as drinking water protection and pollution abatement, and focuses more efficiently the programs of various governmental and non-governmental organizations that are charged with restoring and protecting the water resources of Massachusetts.

In 1993 the twenty-seven major watersheds and coastal drainage areas in Massachusetts were placed on a rotating five-year schedule for monitoring, assessment, TMDL development, surface water permitting and non-point source pollution control. The rotating watershed cycle allows for the synchronization of these water quality planning and management activities within each watershed. During Year 1 of the rotating basin schedule all pertinent data and information relative to water resource management are gathered and reviewed to identify data gaps and the need for additional information. This process culminates in the development of a plan for obtaining this information during Year 2. At a minimum, a Quality Assurance Project Plan (QAPP) is formulated for all environmental monitoring activities to be performed. The scope of the monitoring effort varies depending upon the resources available and the prevailing water quality issues within each watershed. Input from outside agencies and the general public is actively solicited in order to gain further insight with respect to water quality goals and use-objectives.

An overview of Massachusetts' existing surface water monitoring program can be found at <http://www.mass.gov/dep/water/resources/envmonit.htm>. A strategic goal of the MassDEP is to implement a comprehensive monitoring program (status/assessment, trends and flows, and targeted) that serves all water quality management needs and addresses streams, rivers, lakes, reservoirs, estuaries, coastal areas, wetlands, and groundwater. To accomplish this goal and to address a wide variety of water quality-related objectives the agency has developed a multifaceted monitoring strategy that includes monitoring elements, data analysis, reporting, and use of the data for management decisions. Major components of the monitoring program fulfill requirements of the Federal Clean Water Act (CWA) and the Federal Safe Drinking Water Act. This proposed monitoring program, developed in accordance with guidance from the EPA (EPA 2003), is described in *A Water Quality Monitoring Strategy for the Commonwealth of Massachusetts* (MassDEP 2005) and is available on-line at <http://www.mass.gov/dep/water/priorities.htm>.

Results of the monitoring efforts performed in Year 2, combined with all other reliable information, constitute the basis for making water quality assessments during Year 3 of the basin cycle. Assessments are made in accordance with the requirements set forth in Section 305(b) of the CWA and are published in individual watershed water quality assessment reports. The format of these reports is currently undergoing revision but, historically, was a synthesis of many kinds of information pertaining to the ecological and regulatory status of the water resources in the respective watersheds. Each report presented a description of the geophysical characteristics and land uses in the watershed along with information on wastewater discharges, water withdrawals and other issues affecting water quality and ecosystem integrity. The main

feature of the watershed assessment report was, and continues to be, the documentation of the water quality data and information used to assess the status of the designated uses as defined in the Water Quality Standards. Use-attainment determinations are made for each waterbody segment for which adequate data and information are available. However, many waters remain not assessed for one or more uses in any given assessment cycle and many small and/or unnamed streams and ponds have never been monitored and assessed. Watershed assessments are completed sequentially as an integral step in the watershed management cycle. Copies of the watershed assessment reports are distributed to the EPA, in partial fulfillment of the joint State-EPA Performance Partnership Agreement (PPA), and to other interested parties. Assessment reports for all twenty-seven watersheds and coastal drainage areas have now been published. These are listed in the Bibliography and are available at <http://www.mass.gov/dep/water/resources/wqassess.htm>.

Where applicable and feasible, the determination of site-specific water quality criteria, calculation of total maximum daily loads or TMDLs, and the derivation of load/wasteload allocations may be initiated during Year 4 and continued through subsequent years, as necessary. Wastewater and water withdrawal permits may also be issued at this time. Finally, priority waterbodies exhibiting nonpoint pollution problems may be selected for the implementation of Best Management Practices (BMP) Grants, education and outreach to municipalities, or other control strategies. Each of these water quality management programs is described in more detail below.

The Total Maximum Daily Load (TMDL) Program

Section 303(d) of the Clean Water Act and the EPA's Water Quality Planning and Management Regulations (40 CFR Part 130) require states to develop Total Maximum Daily Loads (TMDLs) for waterbodies that are not meeting designated uses under technology-based controls. The TMDL process establishes the maximum allowable loading of pollutants that a waterbody can receive and still meet the SWQS established for protecting public health and maintaining the designated beneficial uses of those waters. Through this process states implement water quality-based controls to reduce pollution from both point and nonpoint sources and restore and maintain the quality of their water resources. TMDL implementation is accomplished through adherence to prevailing regulations and program requirements such as those governing the NPDES permits for point source control and the stormwater management performance standards maintained by conservation commissions under the Wetlands Protection Act. Furthermore, funding priority for CWA Section 319 grants and State Revolving Funds (SRF) is given to watershed clean-up projects that are consistent with TMDL Program requirements.

A specific time frame for developing TMDLs is not set forth in either the statute or regulation governing the TMDL program. However, a TMDL Strategy was developed and noticed for public review and comment as part of the 1998 Massachusetts 303(d) List. This document, prepared in accordance with EPA's 1997 guidance - *New Policies for Establishing and Implementing Total Maximum Daily Loads (TMDLs)* presented Massachusetts' intent to develop TMDLs in accordance with its rotating watershed management program and identified which watersheds would be targeted for TMDL development over the period 2000-2012. Furthermore, in 2001 Massachusetts, with the assistance of consulting services from CH2M HILL, convened a TMDL Steering Committee to evaluate the TMDL Program and make recommendations for its improvement. This committee helped to set goals for prioritizing waters for TMDL development. As previously indicated, because TMDLs can take several years to develop, ongoing commitments to complete specific TMDLs are now included in each State-EPA Performance Partnership Agreement (PPA) and the most recent PPA and MassDEP Work Plan reflect the current priorities for TMDL development (see *Prioritizing Waters for TMDL Development* later in this report). The PPAs, subject to public review and comment, provide a detailed plan of work to be performed during a two-year time period and are reviewed annually. Massachusetts is committed to the development of TMDLs as expeditiously as possible and has devoted substantial monetary and personnel resources to this program.

In accordance with EPA guidelines for developing TMDLs, the MassDEP allocates pollutant loads equitably to contributing point and nonpoint sources. Computer models and other forecasting tools are utilized to evaluate and make recommendations for pollutant allocation alternatives that are feasible and cost-effective. Naturally occurring pollution and seasonal variation are taken into consideration, and a margin of safety is included to ensure that water quality standards are achieved. The general approaches taken for completing TMDLs vary with the complexity and site-specificity of water quality impairments and the actions needed to

correct them. Depending upon the type of impairment and/or the anticipated response TMDLs can be very complex or simplified to achieve the desired goal. The methods employed for deriving TMDLs for the two most commonly occurring pollutants in Massachusetts – nutrients and bacteria – are briefly described below to illustrate the range of approaches that are currently being used.

Nutrient evaluation is often very site-specific and requires intensive data collection and modeling. To develop effective cleanup plans the relationship of nutrients to biomass production and dissolved oxygen concentrations must be assessed. This, in turn, determines the acceptable levels of nutrients for the waterbody of concern. This traditional approach to calculating site-specific TMDLs, while resource intensive, is and has been used to develop nutrient TMDLs for the Assabet River and for the Massachusetts Estuaries Project (MEP). A TMDL for the nutrient phosphorus was recently developed for the Assabet River that receives treated wastewater discharges from four major publicly owned treatment works (POTWs) and three minor facilities. This river was listed on previous Massachusetts 303d lists as impaired primarily for Nutrients and for Organic Enrichment/Low Dissolved Oxygen. These pollutants and stressors are indicators of a nutrient enriched, or eutrophied, system. Data collected in 1999 and 2000 were analyzed to determine the extent of eutrophication, quantify the sources of phosphorus, and construct a dynamic water quality model using the EPA's HSPF model, under a contract to ENSR International, Inc., to evaluate potential control options. The resulting TMDL analysis calls for decreased loadings from POTWs and from certain non-point sources, principally sediment phosphorus flux, and outlines corrective actions to achieve that goal. This TMDL has been developed with special emphasis on reducing the extent of nuisance macrophyte growth, meeting minimum dissolved oxygen criteria, reducing extreme diurnal dissolved oxygen fluctuations and excessive dissolved oxygen supersaturation, and reducing ambient total phosphorus concentrations.

Other examples of complex TMDLs are those being developed by the Massachusetts Estuaries Project (MEP), a collaborative effort between the MassDEP, the School of Marine Science and Technology at the University of Massachusetts, Dartmouth (SMAST) and interested parties to assess the quality of 89 estuaries in southeastern Massachusetts and to recommend measures to be taken to restore those waters that are found to be impaired. As with the Assabet River TMDL, a major focus of the project is on waterbodies impaired by nutrient loadings. Again, a traditional and more complex approach to TMDL development is being followed that includes the following steps:

- 1) Develop a coastal TMDL workgroup for coordination and rapid transfer of results;
- 2) Determine the nutrient sensitivity of each of the 89 embayments in southeastern Massachusetts;
- 3) Provide data collection needed for quantitative modeling including landuse analysis, hydrodynamic modeling and water quality modeling;
- 4) Conduct quantitative TMDL analysis, outreach and planning; and
- 5) Maintain the integrity of each embayment model to address future regulatory needs.

The approaches described above are extremely complex and resource-intensive and can take many years to complete. In some cases a more innovative approach is warranted. For instance, MassDEP is pursuing a more innovative approach to the development of TMDLs for waters contaminated by bacteria. Because the steps to identifying and correcting sources of bacteria are relatively straightforward and more universally applicable, MassDEP, in collaboration with the EPA, is grouping or “bundling” waters exhibiting microbial pollution for the development of more comprehensive clean-up plans for all 27 watersheds in Massachusetts. The goal is to develop clean-up plans (based on currently available data) and general implementation guidance based on different types of land use activities that focus limited resources on finding and eliminating bacterial sources rather than complex water quality modeling. If successful these plans will address approximately 350 water bodies currently impaired due to bacteria contamination.

Finally, and again with the cooperation of the EPA, the MassDEP is attempting to identify certain classes of water quality impairments that may be controlled more effectively through management strategies other than TMDLs. For example, mandated source reductions of toxic contaminants, such as mercury, or the clean-up plans embodied in Records of Decision (RODs) for waste sites may provide the avenues for meeting water quality goals without the actual derivation of TMDLs. Like TMDLs, however, these management strategies will need to provide assurances that the implementation of the recommended control measures will ultimately result in the attainment of applicable water quality goals as defined by the SWQS.

The Wastewater Discharge Permitting and Stormwater Program

Nearly all wastewater discharges to surface waters in Massachusetts are governed by permits that are issued jointly by the EPA and the MassDEP in accordance with both the Surface Water Quality Standards (SWQS) and guidelines set forth as part of the federal NPDES Permit Program. This system establishes levels of effluent quality that must be achieved at municipal, institutional and industrial treatment facilities to ensure that water quality standards are met in the receiving waters. Massachusetts has not been delegated the authority to issue NPDES permits by the EPA. Therefore, the EPA retains the responsibility for the administrative aspects of the program, including drafting the discharge permits, conducting public hearings and issuing the final permit. The MassDEP must provide state certification of the final draft permit prior to issuance in accordance with Section 401 of the CWA. The MassDEP also is a signatory to the final permit, making it a joint permit. This process results in a final discharge permit that is valid under both federal and state law, so each permitting agency has the independent right to enforce its terms and conditions. The federal Clean Water act (CWA) requires that discharges satisfy both minimum technology and water quality requirements.

The MassDEP's Regulatory Program undertakes enforcement actions against violators of the MassDEP's regulations or those in non-compliance with discharge permit requirements. Actions that can be initiated include: notices of non-compliance; administrative orders; administrative penalties; show cause hearings; and case referrals to the State's Attorney General's Office. These regulatory activities are implemented in accordance with the Surface Water Permitting Compliance and Enforcement Strategy and will continue to be a vital component of the state's programs to ensure proper operation of municipal, institutional and industrial treatment facilities.

During the 1970s the Massachusetts Division of Water Pollution Control published river basin plans for over twenty river basins and coastal drainage areas in accordance with the requirements of Section 303(e) of the 1972 Federal Water Pollution Control Act (PL92-500). As part of this planning process, low-flow steady-state simulation models were developed for those basins where waste load allocations (WLA) were needed for the derivation of NPDES permit limits. While these models focused primarily on predicted impacts from conventional pollutants, such as biochemical oxygen demand, they provided the basis for permit limits and treatment technologies at municipal and selected industrial facilities that are still in place today.

The 1980s saw an increased emphasis on the identification and control of toxic pollutants in the aquatic environment. During this time the EPA announced the publication of 65 individual ambient water quality criteria documents for pollutants listed as toxic under Section 304(a) of the CWA. These and subsequent criteria documents were used by the MassDEP to screen ambient water quality data and wastewater discharge data to provide water toxics information to the EPA in 1989 in accordance with the requirements of Section 304(l) of the CWA. Specifically, waterbodies impacted by toxic pollutants and wastewater discharges in need of "individual control strategies" for toxic pollutants were identified and prioritized for implementation. Most of these control strategies involved the issuance of NPDES permits with whole-effluent toxicity (WET) testing requirements and, in some cases, individual numerical effluent limits for toxic contaminants.

In 1990 the MassDEP formally adopted the Section 304(a) criteria as part of its Surface Water Quality Standards, giving them direct regulatory impact. Also that year the MassDEP adopted a "Toxics" Policy that set minimum requirements for whole effluent toxicity testing for NPDES permits. This has resulted in a substantial toxicity database statewide.

The emphasis of the point source control program shifted in the 1990s to address inputs and effects from stormwater and nutrients on surface waters. The stormwater permitting program was initiated nationally by the EPA and initially addressed medium and large municipal systems (medium systems are greater than 100,000 population served by a municipal separate stormwater sewer system ["MS4"], while large systems are greater than 250,000 population), a wide range of industrial activities (controlled through the EPA multi-sector general permit program) and construction activities with a disturbance of land greater than 5 acres. Those programs and permits used the "best management plan" approach rather than the specific permit conditions traditionally used in individual NPDES permits for municipal and industrial discharge sites. Facilities and construction sites were required to develop and implement stormwater

management plans to control runoff, limit transport of pollutants off-site and to mitigate erosion and other habitat alterations associated with stormwater runoff.

The stormwater program expanded its scope to include small municipalities (237 cities and towns in Massachusetts), public entities that operated "MS4" systems, including highways, parks and public entities such as colleges and prisons. The program requirements were set forth in 1999 by the EPA Storm Water Phase 2 regulations and are being implemented in over two-thirds of the municipalities in Massachusetts and several dozen other public "MS4" systems through a general permit program. This aspect of the stormwater program was initiated in 2003.

The control of nutrient (particularly phosphorus and nitrogen) inputs to surface water has long been a challenge to the improvement of water quality. Widespread enrichment of rivers, lakes and ponds and estuaries has resulted in an aggressive approach to control nutrient inputs through source controls using evolving treatment technologies aimed at providing the "highest and best" nutrient removal at over 70 facilities across the state. The need for phosphorus loading reductions to fresh waters is reflected in increasingly low effluent limitations in NPDES permits and subsequent implementation of higher degrees of phosphorus removal at wastewater treatment facilities. Similarly, a nitrogen control strategy for coastal waters has been initiated in the southeastern portion of the state to protect sensitive coastal waters and embayments. Thus far, two publicly owned treatment works (POTW) in Massachusetts are required by the terms of their NPDES permits to limit the concentration of total nitrogen in their effluent discharges. A small number of additional NPDES permits containing nitrogen limits are currently under appeal. It is anticipated that the number of NPDES permits with effluent limits on nitrogen will increase over the next several years as TMDLs are completed for coastal embayments. In fact the management of phosphorus and nitrogen discharges to surface waters will be the focus of the TMDL and wastewater permitting programs for the next ten to twenty years as loading analyses are conducted, TMDLs are calculated, effluent limits are derived, and nutrient reduction technologies are developed or enhanced. This approach, coupled with an aggressive program for non-point sources of nutrients, should greatly improve the water quality of surface waters across the state.

The Water-withdrawal Permitting Program

Enacted in 1985, the Massachusetts Water Management Act (WMA) regulates all withdrawals from ground and surface water sources that exceed an average annual volume of 100,000 gallons per day (gpd). The WMA allowed all withdrawals of this magnitude that existed between 1981 and 1985 to be registered if they correctly applied by January 4, 1988. The MassDEP allowed registrants to continue these historic withdrawals provided that they meter or otherwise verify their actual water use and that they report their usage annually. New withdrawal points or increased withdrawal volumes from registered points exceeding the WMA threshold of 100,000 gpd sought after 1985 are required to obtain a withdrawal permit. The application review process considers other withdrawals within the same watershed. This process includes an analysis of the potential local impacts that may result from the proposed withdrawal. Included in this local impact analysis is the identification of resources affected by water level fluctuations and a determination of acceptable groundwater levels for those resources. The impact of water withdrawals on surface water quantity and quality, as well as the effects of induced infiltration on the quality of the withdrawal water, are considered as a part of the review. Permit conditions require water conservation and appropriate source operation and management measures to minimize impacts on sensitive environmental receptors, including other water users.

The Nonpoint Source Program

Nonpoint source (NPS) pollution results from the flow of rainfall or snow melt over and through the ground and the subsequent transport of contaminants from natural and anthropogenic sources into surface or groundwater. Atmospheric deposition, in-place sediments, and hydrological modifications are also sources of nonpoint pollution. In the past the EPA and the states have focused water pollution abatement programs on the control of point sources through waste load allocation and NPDES permitting. Nonpoint source pollution is not as easily assessed nor controlled, for it is intricately linked with the use of the land and land-use decisions are made at the local level. For this reason federal and state efforts are aimed at educating local officials and the public-at-large with respect to the importance of land-use planning and zoning, the use of best management practices (BMPs) to control stormwater, and other measures for preventing nonpoint

pollution. Critical to the success of this approach is the establishment of partnerships between all of the parties that have an interest in the process. By bringing these parties together problems are identified and prioritized and innovative solutions are developed. Moreover, the watershed represents a logical planning unit on which to focus this effort.

While the relationship between land use and water quality in the watershed is generally recognized, scientifically valid approaches to identifying and quantifying nonpoint pollution sources and predicting the results of proposed control measures on downstream water quality are not well developed. Nonetheless, several watershed-scale models have been developed in recent years that can be used as screening tools for predicting nonpoint pollution loading from storm events based on knowledge of land-use characteristics. These screening procedures require little input data or calibration and verification and, consequently, output is not highly accurate. They can, however, be used to make relative comparisons between subwatersheds and to highlight areas for more intensive data gathering and modeling efforts. It is anticipated that the control of nonpoint pollution will be an iterative process whereby the implementation of BMPs will be followed by monitoring to measure their effectiveness and to identify needs for further load reductions.

The Nonpoint Source Management Plan was originally developed by the MassDEP in 1988 pursuant to Section 319 of the CWA. This plan, updated in 1994 and 1999, sets forth an integrated strategy for the prevention, control, and reduction of pollution from nonpoint sources in an effort to protect and improve the quality of the waters of the Commonwealth and serves as a framework on which the changes to the State Revolving Fund (SRF) regulations are built.

The Massachusetts Nonpoint Source Management Plan includes the following components:

Volume I - Strategic Summary of the Massachusetts Nonpoint Source Management Plan. This document binds together all of the action strategies of the Management Plan into a cohesive, yet compact, report.

Volume II - The Nonpoint Source Program and The Massachusetts Watershed Initiative. This is the traditional Volume I of the Management Plan.

Volume III - The Statewide Plan and Its Goals. This is the traditional Volume II of the Management Plan.

Volume IV - Nonpoint Source Watershed Action Strategies. This volume will include the NPS Action Strategies for all 27 watersheds as developed by the NPS regional coordinators.

Each year Congress appropriates funds under Section 319 to assist the states with the implementation of their approved Nonpoint Source Management Plans. Implementation activities include: regulatory enforcement, technical assistance, education, training, technology transfer, watershed restoration, and demonstration projects. Only those implementation strategies identified in the Management Plan are eligible for federal funding. Since 1990 and extending through 2006, the MassDEP has procured (185) Section 319 nonpoint source management projects, which total \$27,963,560.

As stated above the state Nonpoint Source Management Plan is implemented on a prioritized watershed basis. This pertains to the core Nonpoint Source Program funded under Section 319 of the CWA. Not all of the ancillary state programs that address nonpoint source pollution are similarly focused. Nevertheless, the MassDEP promotes the use of a watershed approach by other state agencies and public entities in the implementation of the Nonpoint Source Management Plan.

In addition to the Nonpoint Source Management Plan, MassDEP recently updated its Nonpoint Source Management Manual. Now referred to as the Water Quality Toolkit, the manual is a compilation of nonpoint source best management practices that was first developed in 1998. Since then our understanding of nonpoint source issues and best management practices has evolved, as have the options for presenting and distributing such material. A Section 319 grant was used to revise and update the Manual in electronic and web-based form as well as in print. New topics include municipal good housekeeping, low impact development, Phase II stormwater, and related material. The Water Quality Toolkit can be accessed at the following website: <http://www.mass.gov/dep/water/resources/nonpoint.htm#megaman>

The enactment by Congress of the 1990 amendments to the Coastal Zone Act (CZARA) has significant implications for the Massachusetts Nonpoint Management Plan. Section 6217 of CZARA includes the requirements and specifications for the development of state coastal nonpoint source management plans in accordance with program guidance from the National Oceanographic and Atmospheric Administration (NOAA) and technical guidance from the EPA. The technical guidance contains requirements, or management measures, for nonpoint source controls that state programs must ensure will be implemented in an enforceable manner. The coastal management plans must assess the enforceability and effectiveness of existing programs for controlling nonpoint source pollution and propose changes to correct gaps in legislative or regulatory authorities for addressing nonpoint source pollution. In Massachusetts the MassDEP and the Massachusetts Office of Coastal Zone Management (MCZM) have agreed that the coastal nonpoint pollution control program will be an integral part of the comprehensive state Nonpoint Source Management Plan. The provisions of the coastal plan will thus be implemented statewide to maintain consistency of purpose and applicability of nonpoint source management strategies. This agreement has been formalized in a Memorandum of Understanding, which establishes a working relationship between the two agencies and clarifies their roles with regard to the development and implementation of the Coastal Nonpoint Pollution Control Plan. The Massachusetts Coastal Nonpoint Source Program is one of only a handful of such programs nationwide that have received full approval from the National Oceanic and Atmospheric Administration (NOAA) and Environmental Protection Agency (EPA).

The MassDEP and the MCZM collaborated on a Stormwater Management Policy. In addition to existing control mechanism guidance, the policy provides performance - based standards and the tools necessary to undertake a stormwater control program. The policy, directed at Conservation Commissions, Planning Boards and developers, was issued in November 1996 followed by publication of a two-volume handbook in March, 1997. Further, the EPA/MassDEP (joint permits) Phase II Stormwater Program will help abate many of the municipal nonpoint sources of pollution presently impacting waters of the Commonwealth. The MCZM administers the Coastal Pollutant Remediation (CPR) Program, a grant initiative to municipalities within the Massachusetts Coastal Watershed for projects to remediate stormwater from roadways and for marine pump-out facilities. Funded through the Commonwealth's transportation bond, the CPR Program hopes to achieve the following goals: 1) to remediate known stormwater discharges that are impacting on natural resources and human uses (e.g., shellfish, fish habitat, swimming beaches), 2) to gather data in areas of suspected water quality problems, where stormwater is the expected source, but where there are no data to confirm the problem, 3) to demonstrate new technologies in Massachusetts, and 4) to measure the long-term performance of a variety of traditional and new stormwater technologies.

In August 1996 the Rivers Protection Act passed the state legislature. This new law creates protected riverfront areas that extend 200 feet on both sides of rivers and streams and imposes restrictions on any development within those areas. In densely populated areas the riverfront area is reduced to 25 feet. Developers have to demonstrate that their proposed projects will have no adverse impacts on the riverfront areas and that there is no practicable alternative for development. The enactment of this law and the issuance of the stormwater policy are anticipated to be major milestones in curbing nonpoint source pollution. Regulations promulgated under the Rivers Protection Act took effect on October 1997.

On October 23, 2003, the EPA issued new guidelines promoting the use of Section 319 funding for developing and implementing Watershed-Based Plans to protect unimpaired waters and restore impaired waters. Watershed-Based Plans to restore impaired waters are required for all projects implemented with Section 319 incremental dollars, and are recommended for all watershed projects, whether they are designed to protect unimpaired waters, restore impaired waters, or both. In response to the new EPA guidelines, the MassDEP retained a consultant to develop a statewide watershed-based plan organized according to the 27 major planning basins and sub-organized by 12-digit HUC code areas. The result was a web-based product that allows stakeholders and grant applicants to identify known and likely causes and sources of nonpoint source pollution in their watersheds. It also helps to prioritize the NPS problems, identify appropriate best management practices and watershed-based strategies for addressing the problems, and develop winning proposals to fund the work using 319 nonpoint source competitive grant funds or similar programs. The State Revolving Fund (SRF) Program

The Massachusetts State Revolving Fund (SRF) for water pollution abatement projects was established to provide a low-cost funding mechanism to assist municipalities seeking to comply with federal and state water quality requirements. MassDEP's Division of Municipal Services (DMS) and the Massachusetts Water Pollution Abatement Trust jointly administer the SRF Program. Each year the MassDEP solicits projects from Massachusetts municipalities and wastewater districts to be considered for subsidized loans, which are currently offered through a two percent interest loan. In recent years the program has operated at a capacity of \$300 to \$400 million per year, representing the financing of 50 to 70 projects annually. The SRF Program places increased emphasis on watershed management priorities. A major goal of the SRF Program is to provide incentives to communities to undertake projects with meaningful water quality and public health benefits and which address the needs of the communities and the watershed.

Financial assistance is available for planning, design and construction of projects, including new wastewater treatment facilities and upgrades of existing facilities; infiltration/inflow correction; wastewater collection systems; control of combined sewer overflows (CSO); Brownfields water resource infrastructure improvements; and nonpoint source pollution abatement projects, such as landfill capping, community programs for upgrading septic systems (Title 5), and stormwater remediation. In addition, non-structural projects are eligible for SRF funding; e.g., planning projects for nonpoint source problems that are consistent with the MassDEP's Nonpoint Source Management Plan and that identify pollution sources and suggest potential remediation strategies.

The DMS develops an Intended Use Plan for projects based on a ranking system that promotes watershed-based planning and solutions, with particular focus on infrastructure solutions that promote sustainable development. The draft list is published and widely distributed, in print and electronic format, in advance of a public comment period and a public hearing. Major SRF investment currently goes toward projects such as Boston Harbor, Connecticut River, and Merrimack River combined sewer overflow (CSO) mitigation. In addition considerable funding is going toward nonpoint pollution control projects including failing septic systems. The MassDEP has revised its SRF regulations to provide municipalities with financial assistance for the correction of nonpoint source pollution consistent with the Nonpoint Source Management Plan. New and expanded sewer systems and stormwater management planning continue to receive support.

The demand for funds outstrips their availability, thus creating a backlog of eligible projects and extending the time for abatement programs to be completed. The CWA authorized funds to be allocated to states through annual capitalization grants, distributed by the states as state revolving funds. These funds, when used with the mandatory 20 percent state match, are then made available as 2% loans to municipalities to help finance critical water pollution abatement projects. Massachusetts has issued nearly \$4 billion in loans since the inception of the SRF, yet there remains an equivalent amount of unfunded wastewater needs and the ultimate success of the program will require continued expenditure of significant funds over the next decade and beyond. CSO mitigation comprises a significant portion of this need. Another significant investment will be to upgrade and rehabilitate wastewater treatment facilities. Many of these plants were constructed in the early aftermath of the enactment of the CWA, using funding from the Construction Grants Program, the precursor to the SRF. As these facilities have begun to reach the end of their design life and because nutrient removal is often a NPDES requirement, the cost to rehabilitate them will be substantial. Finally, the 1997 revisions to the SRF regulations made it possible for municipalities to borrow money to complete comprehensive assessment activities and to fund the implementation of nonpoint source "best management practices" (BMP), as well as traditional point source water pollution control projects.

MASSACHUSETTS WETLANDS PROTECTION AND ASSESSMENT PROGRAMS

The Wetlands Regulatory Program

MassDEP protects inland and coastal wetlands pursuant to the Massachusetts Wetland Protection Act (WPA) (M.G.L. Ch. 131 § 40) and the WPA regulations (310 CMR 10.00). The WPA regulations provide strong protection of bordering vegetated wetlands, allowing for no more than 5000 square feet of alteration and requiring full replacement in most cases, and only if the altered area is replaced in a manner that will function similarly to the lost area. In Massachusetts, implementation of the WPA is

administered by local Conservation Commissions and approximately 8,500 applications ('Notices of Intent') are submitted each year. MassDEP is responsible for appeals, Water Quality Certifications (WQC) under Section 401 of the Clean Water Act and enforcement.

Wetlands Loss

Until recently, MassDEP has had no comprehensive strategy to monitor compliance with permits, or to identify illegal wetland fill. In 2001, MassDEP initiated a unique state-of-the art digital aerial surveillance program, using remote sensing data to identify wetland alterations from activities such as clearing, building or filling. Aerial imagery flown in 2001 was compared to imagery flown between 1990 and 2000. In 2005, MassDEP obtained new aerial imagery and compared it with imagery from 2001. Through this ongoing effort, MassDEP is developing reliable and verifiable data on freshwater wetland loss (see table below).

Years	Total acres of wetlands	Total acres lost	Change as % of acreage
1990-2005	736,433.15	1,266.08	0.17%

MassDEP has also examined the areas of loss to see what types of activities account for the most change. The latest 2005 imagery analysis shows that commercial and residential development continues to be a large cause of wetland loss, and loss from agricultural and cranberry bog activities accounts for a smaller percentage of overall loss (see table below). Assessing the factors that have contributed to the losses enables MassDEP to reduce losses in the future by targeting compliance, enforcement, and outreach to sectors contributing to the greatest losses.

Cause	Acres Lost	
	2001	2005
Agriculture	205.8	34.7
Commercial Development	119.1	60.2
Cranberry Bog Activity	(See agriculture)	46.3
Other	133.8	107.9
Gravel Operation	35.0	26.9
New Road	--	13.9
Dock or Pier	--	3.8
Residential Development	143.3	93.0
Transportation Infrastructure	--	11.1
Clearing - Unknown reason	--	79.0
Filling - Unknown reason	--	7.7
Total Acres	637	484.5

MassDEP does not currently have a database that allows for accurate reporting on the extent of permitted vs. unpermitted wetlands losses. However, a sample review of wetland loss areas in 92 towns based on 2001 imagery indicated that about 15%, or 95 acres of the 635 acres filled were likely permitted and over 50% of the fill was illegal or likely illegal. Based on those data, MassDEP concluded there was a need to reallocate program functions by reducing permitting task time in order to increase enforcement efforts. Furthermore, with grant funding from the EPA, MassDEP initiated in 2005 a 3-year effort to link electronic applications and data on enforcement actions with digital wetland-loss maps. When complete, the new data system will provide staff members with enhanced capacity to distinguish between permitted vs. illegal wetland loss from the desktop rather than extensive paper file review; and improved tracking of where the creation, restoration or enhancement of wetlands succeeds or fails. Ultimately, it is the goal of the MassDEP to have more reliable data on statewide "net" loss, as well as on wetland gain which will assist in the development of better and more flexible strategies to prevent further wetland loss and achieve wetland gain.

Wetlands Monitoring and Assessment Strategy

Toward the goal of implementing a comprehensive water quality monitoring and assessment program that includes wetlands, MassDEP joined with the University of Massachusetts in Amherst (Umass) to develop the *Massachusetts Wetlands: Monitoring and Assessment Strategy*. The central feature of this strategy,

which was submitted to the EPA in April 2007, is the Conservation Assessment and Prioritization System, or CAPS, a landscape-level assessment model that has been under development by UMass for several years, and which was adopted by MassDEP in 2006 for wildlife purposes. Key components of CAPS are land-cover mapping derived from GIS mapping and satellite imagery and 21 integrity metrics developed by expert teams, combined in a model that calculates a value between 0 and 1 for every 30² point in the landscape. The CAPS value represents the ‘index of ecological integrity’ or *prediction*_about the ability of the wetland to sustain its ecological condition in the long term and to recover from stress. CAPS does not assess ecological conditions on the ground, nor does it use field-based information in the CAPS models. Site-Level Assessments (SLAMs) and subsequent development of Rapid Assessment Methods (RAMs) that provide information about ecological condition for a large number and wide range of wetlands are essential for testing and validating the CAPS predictions and modifying (as needed) the CAPS models. The focus of effort in 2008 is the development of a SLAM to understand how wetland condition is influenced by land use in the surrounding landscape.

Another purpose of this strategy is to develop wetland quality standards. It is generally expected that wetlands in more developed landscapes will have lower condition scores than wetlands in more natural landscapes. Once the relationship between wetland condition and land use in the surrounding landscape is determined, particular wetlands can be identified for additional protection or restoration. Some wetlands are likely to deviate from such a relationship due to site-specific human impacts such as dumping, chemical spills or buffer zone encroachment and these could be the focus of additional protection or restoration measures. Using CAPS and the condition data collected in the field, the relationship between landscape context (CAPS IEI scores) and wetland condition (SLAM/RAM scores) can be plotted for each wetland type. Those wetlands that fall outside of some determined range of acceptable values could be targeted for additional protection or remediation/restoration action.

Data collection began in 2007 and, since CAPS values are calculated for all points on the landscape, both wetland and terrestrial sites were included. Data were collected from 57 wetlands sites in the Westfield River Watershed and 96 terrestrial sites in the Deerfield River Watershed.

Wetlands sites included 26 forested wetlands and 31 scrub-shrub wetlands. Wetland Assessment Areas (AA) were measured with a 50m radius from the plot center. Data on wetland condition (e.g. vegetation, hydrology, soils) were collected within 30m of the AA center. Data were collected on hydrologic and human disturbance stressors within the entire 50 m AA (e.g. stormwater inputs, culverts, dams, trails, garbage dumping, impervious surface, invasive species). Major channels were walked 100m from center. Data were categorized within the inner (7.6m), middle (7.6m) and outer buffer zone (15m).

The following statistics were derived from the wetland data:

1. Approximately 46% of the sites had at least 1 stressor in the wetland, including hydrologic and human disturbance.
2. Wetland stressors included: roads/trails associated with motorized/non-motorized vehicles (7%); Hydrologic stressors (12%); and other stressors such as trash, garbage dumping and mowing (35%).
3. Hydrologic stressors were present within 100m of the AA center in 25% of the sites.
4. Approximately 63% of the sites had at least 1 stressor in the buffer zone.
5. Stressors were present in the inner buffer zone (53% of sites), middle buffer zone (51% of sites) and outer buffer zone (49% of sites).
6. 44% of the sites had invasive species.

Although data are currently being analyzed, a general decrease in the number of stressors and invasive species richness was observed as CAPS ecological integrity scores increased.

Terrestrial data collection focused on lichens, plants, invertebrates and invasive species of earthworms as indicators of condition in upland areas surrounding wetlands. Although the data are currently under analysis, generally, invasive plants and earthworms were found to increase with lower ecological integrity scores. Additional data collected in the 2008 season, from existing as well as new sampling sites, will contribute toward a clearer understanding of trends. Data will be updated in the *2010 Massachusetts Integrated List of Waters*.

THE MASSACHUSETTS SURFACE WATER QUALITY STANDARDS

The establishment of achievable goals for surface waters is fundamental to their restoration and protection. To this end states adopt surface water quality standards (SWQS) that ascribe these goals in the form of beneficial uses that are assigned to specific defined waterbodies. For example waters may be designated for the support of aquatic life, recreational use, and fish and shellfish consumption. The SWQS also specify criteria that waterbodies must meet in order to support their assigned uses. Criteria may be expressed as numerical values that should not be exceeded in ambient water, such as a mean coliform bacteria count of 200 colonies per 100 ml, or a minimum instream dissolved oxygen concentration of 5 mg/l. Alternatively, water quality standards may include narrative statements that waters shall be free from constituents in concentrations that would impair their intended uses.

Whether numerical or narrative in form, criteria must be closely related to the uses that they are intended to protect. The bacterial content of waters designated for recreational purposes, for example, must be specified at a level low enough to minimize the risk of water-borne diseases to humans who come into contact with those waters. Likewise standards for metals or other potentially harmful constituents must be set at concentrations below levels that could be toxic to humans or other organisms living in or on the water.

The SWQS assign all inland and coastal and marine waters to classes according to the intended beneficial uses of those waters. For example Class A waters are designated as the source of public water supplies and, where compatible with this use, should also be suitable for supporting aquatic life, recreational uses such as swimming and boating, and fish consumption. Class B waters are not water supplies, but are designated for all of the other uses cited above for Class A. Finally, Class C waters should be suitable for aquatic life and recreational uses where contact with the water is incidental, such as boating and fishing, but may not be suitable for swimming, diving, or water skiing. Inland waters are also subcategorized as to fishery type ("cold water fishery", "warm water fishery" or "aquatic life") based on the waterbody's natural capacity to support these resources. Massachusetts' coastal and marine waters are assigned to classes (i.e., SA, SB and SC) that distinguish shellfish harvesting and recreational uses while providing suitable habitat for wildlife, fish and other aquatic life. In any case, minimum criteria (e.g., dissolved oxygen, temperature, etc.) are specified for each class based on the most sensitive use designated to that class. Additional criteria that apply to all surface waters are also included in the SWQS.

Some waters are designated for special protection under the antidegradation provisions of the SWQS. These provisions restrict or prohibit the authorization of wastewater discharges to critical resource waters. Most notable is the Outstanding Resource Water (ORW) designation that applies to all Class A waters and certain Class B, Class SA and Class SB waters. These waters exhibit exceptional socio-economic, recreational, ecological and/or aesthetic qualities. The MassDEP published a comprehensive listing of ORWs in 1993 and, again, in 1995. Outstanding Resource Waters include, but are not limited to, Class A public water supplies and their bordering vegetated wetlands and vernal pools certified as such by the Massachusetts Division of Fish and Game. Other waters designated as ORWs may include those protected by special legislation, as well as selected waters found in National Parks, State Forest and Parks, or Areas of Critical Environmental Concern (ACECs).

As previously noted, the derivation of criteria that must be met to attain various water uses is a scientific process aimed at determining safe or acceptable levels of water constituents. The establishment of goals in the form of use assignments to individual waterbodies, on the other hand, is a policy decision that must take into account the existing and pre-existing conditions of those waters, as well as the costs and benefits of achieving the uses. Thus, the adoption of water quality standards is a public process and the CWA specifies that states hold public hearings at least once every three years to review and, where appropriate, revise their water quality standards. Following a public review process held in January-February 2006, MassDEP adopted the most recent revisions to the SWQS on December 29, 2006. These were subsequently submitted to the EPA for review in January 2007, and on March 26, 2007 the EPA approved some revisions while indicating that the remaining revisions proposed by MassDEP were still under review. In September 2007, the EPA approved an additional set of the revisions adopted in 2006. Once again, however, they did not approve all of the changes.

From this brief overview it should be evident that the process of assessing surface waters (305b) and listing impairments (303d) is inextricably linked to the Surface Water Quality Standards, as they define the uses that are to be evaluated for any given waterbody and the criteria for determining whether or not those uses are, in fact, supported. Furthermore, SWQS changes from one triennial review to the next can alter the methodology used to make assessment and listing decisions. Since assessments are sequentially carried out as part of MassDEP's rotating watershed management schedule, it is entirely possible for more than one assessment methodology to be represented within a single integrated list report. In fact, the 2008 listing cycle includes watershed assessments that were completed both before and after the newly revised SWQS were approved in 2006, thus representing slightly different assessment and listing criteria.

GENERAL APPROACH TO ASSESSING MASSACHUSETTS' WATERS

Sources of Information

Reliable scientific data and technical information are essential for making water use assessments. It is EPA policy (EPA Order 5360.1 CHG 1) that any organization performing work for or on behalf of the EPA must establish a quality system to support the development, review, approval, implementation, and assessment of data collection operations. To this end, the MassDEP describes its Quality System in an EPA-approved Quality Management Plan to ensure that environmental data are of known and documented quality and are suitable for their intended use. In preparing lists of impaired waters to meet Section 303(d) requirements states must consider all existing and readily available data and information. Since MassDEP sequentially prepares watershed assessment reports within the broader context of its five-year rotational watershed monitoring, assessment and management schedule, MassDEP also solicits data and information from any and all potential external parties in adherence to that same rotating watershed schedule. In any case, data and information from third parties are subject to the same documentation and validation procedures utilized for data generated by MassDEP. In order to accept data from third parties to be used for Section 303(d) listing and other related regulatory purposes the MassDEP requires the following: 1) an appropriate Quality Assurance Project Plan including a laboratory Quality Assurance/Quality Control (QA/QC) plan, 2) use of a state certified lab (certified for the applicable analyses), 3) data management QA/QC are described, and 4) the information be documented in a citable report that includes QA/QC analyses.

Specific sources of information used for assessments can be found in individual watershed reports. They include monitoring data reports from state and federal agencies and nongovernmental organizations (NGO), as well as reports on projects resulting from state or local grants or federally funded through sections 314, 319, 104(b)3, or 604(b) of the CWA.

Section 314 of the CWA provided for cooperative agreements between federal, state and local entities to restore publicly owned freshwater lakes and ponds and protect them against degradation. During the late 1970s through the early 1990s diagnostic and feasibility (D&F) studies were completed for several lakes and ponds throughout Massachusetts and these were used in earlier 305(b) assessments and 303(d) listing decisions. Information from these studies continues to carry over into new assessment and listing cycles unless new monitoring information results in a change in their assessment and listing status. Likewise, information contained in the nonpoint source assessment report prepared in 1989 in accordance with the requirements of Section 319 is also reflected in 305(b) and 303(d) reporting elements unless more recent information has resulted in a modification of the original assessment.

The following generic list provides sources that are typically consulted when making watershed assessments. Note, however, that this list is not complete and individual watershed assessment reports should be consulted for specific lists of references.

Assessment Procedure

The CWA Section 305(b) water quality reporting process, embodied in the MassDEP individual watershed assessment summaries and the Integrated List, is an essential aspect of the Nation's water pollution control effort. It is the principal means by which the EPA, Congress, and the public evaluate existing water quality, assess progress made in maintaining and restoring water quality, and determine the extent of remaining problems. In so doing, the States report on waterbodies within the context of meeting their designated uses. These uses include: *Aquatic Life, Fish Consumption, Drinking Water, Primary Contact Recreation, Secondary Contact Recreation, Shellfish Harvesting and Aesthetics*. Two subclasses of Aquatic Life that are also designated in the standards are Cold Water Fishery (capable of sustaining a year-round population of cold water stenothermal aquatic life, such as trout), and Warm Water Fishery (waters that are not capable of sustaining a year-round population of cold water stenothermal aquatic life).

As stated earlier, the SWQS prescribe minimum water quality criteria to sustain the designated uses. Furthermore, these standards describe the hydrological conditions at which water quality criteria must be applied: *"For rivers and streams, the lowest flow condition at and above which aquatic life criteria must be applied is the lowest mean flow for seven consecutive days to be expected once in ten years (7Q10)...In waters where flows are regulated by dams or similar structures, the lowest flow condition at which aquatic life criteria must be applied is the flow equaled or exceeded 99% of the time on a yearly basis, or another equivalent flow agreed upon by the Department and the federal, state or private entity controlling the flow...In coastal and marine waters and for lakes and ponds, the Department will establish extreme hydrologic conditions at which aquatic life criteria must be applied on a case-by-case basis."* (314CMR 4.03(3)).

The determination of whether or not a waterbody supports each of its designated uses is a function of the type(s), quality and quantity of available current information. Although data/information older than five years are usually considered "historical" and used for descriptive purposes, they can be utilized in the use attainment determination provided they are known to reflect the current conditions. While the water quality standards prescribe minimum water quality criteria to sustain the designated uses, numerical criteria are not available for every indicator of pollution. Best available guidance in the literature may be applied in lieu of actual numerical criteria. Excursions from criteria due solely to "naturally occurring" conditions do not constitute violations of the SWQS and are not causes of use impairment.

Each designated use within a given segment is individually assessed as **support** or **impaired** provided that adequate data and information are available to make an assessment. If insufficient data or information exists, the use is **not assessed**. Often segments are assessed for some uses and not for others. It is important to note that many waters are not assessed for any uses. Many small and/or unnamed ponds, rivers, and estuaries are currently **unassessed**; the status of their designated uses has never been reported to the EPA in Massachusetts 305(b) reports or in the Integrated List.

Because the 2008 listing cycle includes watershed assessments that were completed in accordance with more than one set of criteria, detailed methods for individual designated uses are not presented here. Assessments of waters in the Charles and Connecticut watersheds followed revised protocols based on the most recent version of the SWQS published in December 2006. These can be found in MassDEP's individual assessment reports covering those watersheds. All other watershed assessments reflected in the 2008 Integrated List were based on earlier protocols that were published in *Massachusetts Year 2006 Integrated List of Waters* in addition to the respective watershed assessment reports.

Assessment Documentation

MassDEP typically provides details pertaining to the assessment process and its application to specific waterbodies in individual watershed assessment reports that are completed on a continuous rotating schedule. Although the format of these reports is currently undergoing revision, their purpose is to present, for each segment or "assessment unit" (AU), a determination with regard to whether or not individual designated uses are supported. These watershed assessment summaries are a useful means for conveying what is known about the status of the water resources in each watershed and to make the assessment and listing process more transparent to the EPA and the general public. As such, the assessment summaries are also considered a fundamental element of Massachusetts' submittal to the EPA under Section 305(b) of the CWA. Irrespective of how states choose to report on the status of their waters, however, the EPA encourages states to also store assessments in an electronic database designed for that purpose. For earlier listing cycles, up to and including 2002, MassDEP stored assessments in EPA's Water Body System (WBS). For each segment in the WBS a use-support determination was made and, whenever possible, causes and sources of impairment were specified. In doing so, MassDEP analysts could select from a list of approximately 30 pre-existing "causes" available from the WBS program.

The EPA discontinued its support of the WBS after the 2002 listing cycle. Instead, the newly developed "Assessment Database" (ADB) was introduced as the preferred database application for tracking water quality assessment data, including use attainment, and causes and sources of impairment. The ADB was designed to improve the quality and consistency of water quality reporting, improve water quality data analysis, and reduce the burden of preparing reports under sections 305(b), 303(d), 314 and 319 of the Clean Water Act. One of the many enhancements offered by the ADB is the availability of over 400 different "causes" that can be specified as contributing to the non-attainment of designated uses. This allows for more detail to be presented in the Integrated List with respect to the nature of the impairments. For example, the non-specific "nutrients" cause used by the WBS is further resolved in the ADB through the use of such causes as "Phosphorus (Total)", "Nitrogen (Total)", or even "Nutrient/Eutrophication Biological Indicators". Likewise, specific metals available to ADB users, such as copper or nickel, now replace the general term "metals" used by the WBS. A list of WBS cause codes and corresponding ADB causes is presented in the following table.

How Cause Codes from the Water Body System (WBS) were mapped to the Assessment Database (ADB)

The above table represents the majority of the conversions that were made (see below) from WBS to ADB "causes" but does not necessarily list them all. As stated earlier, the ADB offers approximately 400 different codes that can be used when making assessments. MassDEP attempted to reduce these to a manageable number by focusing on those that matched most closely the kinds of data and information that are typically available for Massachusetts' waters. More information pertaining to the ADB can be accessed at <http://www.epa.gov/waters/adb/>.

Due to resource limitations and other unforeseen obstacles encountered in making the transition to the new ADB, MassDEP developed an interim "Integrated List" database for generating the various categories of the Integrated List for both the 2004 and 2006 reporting cycles. And, while MassDEP began utilizing the ADB "causes" with the publication of the 2000 watershed assessment reports, the integrated lists for 2004 and 2006 continued to use the old WBS "causes" for consistency until the use of the ADB could be initiated. This allowed for the direct comparison of impairments from one reporting cycle to the next. With the development of its Year 2008 Integrated List, MassDEP has initiated the process of populating the ADB with the new assessments completed for the **Charles, Connecticut, Hudson, Housatonic and Ten Mile** watersheds and the **North Coastal** drainage areas. As part of this process, all segments, referred to as "assessment units" (AU) in the ADB, were carefully reviewed, whether or not new data and information were available to make an assessment, to ensure that older WBS "causes" were properly translated or "mapped over" to the new ADB "causes". Only the above mentioned six watersheds were input to the ADB for the 2008 reporting cycle. The remaining watersheds were retained in the Integrated List database with the impaired segments labeled with the WBS "cause" codes. The two separate databases were then merged to create the 2008 Integrated List.

It should be noted that the WBS and "Integrated List" databases were never populated with a file for every surface water or segment thereof in Massachusetts, nor will the ADB be populated in that manner. Rather, these databases contain only those segments for which assessments of one or more designated uses were actually completed at one time or another in the past. As assessments are carried out in new waters, these will be added to the ADB resulting in greater representation of Massachusetts' surface waters in future versions of the Integrated List. MassDEP acknowledges that with the new multi-part listing format, all surface waters could be categorized whether or not they have ever been assessed. However, the time and resources are currently not available to add all of the surface waters in Massachusetts to the ADB. Therefore, it is acknowledged that many of Massachusetts' surface waters that have never been assessed are missing from the 2008 Integrated List. By definition, however, they are all Category 3 waters.

DEVELOPMENT OF THE 2008 INTEGRATED LIST

The EPA's guidance for the development of the 2008 Integrated List was provided to the states in the form of a memorandum, dated October 12, 2006, from Diane Regas, Director of EPA's Office of Wetlands, Oceans and Watersheds, to the EPA regional Water Division directors. In it, she recommended that, when preparing their 2008 integrated reports, states follow the *Guidance for 2006 Assessment, Listing and Reporting Requirements Pursuant to Sections 303(d), 305(b) and 314 of the Clean Water Act* that was published on July 29, 2005. The memorandum also contained guidance and clarification on several issues pertaining to the preparation and review of the 2008 list submittal. This included, but was not limited to, a compilation of best practices employed by states to complete and submit lists on time, clarification on the use of Category 4b, information on how to address listing of waters impaired by mercury, a statement on the continued commitment to support and populate the ADB, and the use of the "watershed approach" for listing and prioritizing waters and scheduling water management activities.

The Final *Massachusetts Year 2006 Integrated List of Waters* was submitted to the EPA in August 2007 and the 303(d) List was approved one month later. The 2006 submittal, along with the new EPA guidance described above, served as the basis for the development of the 2008 Integrated List. The MassDEP watershed assessments are continuously performed according to the rotating watershed schedule and existing and readily available data and information pertaining to each watershed are solicited from all potential sources at the outset of this process. Since the time the 2006 Integrated List was prepared, new assessments have been completed for the Charles, Connecticut, Hudson, Housatonic, and Ten Mile watersheds and the North Coastal drainage areas, and these assessments furnished the majority of new

information in support of the 2008 listing decisions. A complete list of the MassDEP watershed assessment reports embodied in the 2008 categorization of waters can be found in the Bibliography.

List Categories 1 - 4

Integrated List categories 1-3 include those waters that are either unimpaired or unassessed with respect to their attainment of designated uses. Often insufficient data and information exist to assess all designated uses of any particular waterbody or segment. Furthermore, no Massachusetts waters are listed in Category 1 because a statewide Department of Public Health advisory pertaining to the consumption of fish precludes any waters from being in full support of the fish consumption use (see Fish Consumption Advisories later in this section). Waters listed in Category 2 were found to support the uses for which they were assessed, but other uses were unassessed. Finally, Category 3 contains those waters for which insufficient or no information was available to assess any uses. Waters for which assessments were determined to be insufficient for 303(d) listing were also included in Category 3. A small number of unimpaired or unassessed waters have TMDLs associated with them. Unlike the much larger number of "restorative" TMDLs developed for impaired waters, these "protective" TMDLs were developed as planning tools to prevent water pollution problems in the future. Protective TMDLs are not cited in categories 2 and 3 of the Integrated List, but they do appear in Appendix 1 where all segments governed by TMDLs are listed.

Waters exhibiting impairment for one or more uses are placed in either Category 4 (impaired but not requiring TMDLs) or Category 5 (impaired and requiring one or more TMDLs) according to the EPA guidance. Category 4 is further divided into three sub-categories – 4a, 4b and 4c – depending upon the reason that TMDLs are not needed. Category 4a includes waters for which the required TMDL(s) have already been completed and approved by the EPA. However, since MassDEP chooses to list each segment in only one category, waters that have an approved TMDL for some pollutants but not others remain in Category 5 until TMDLs are approved for all of the pollutants. A list of all of the TMDLs approved by the EPA is provided in the table below. The complete report citations are presented in the Bibliography. Reference is made to the Control Numbers (CN) of the applicable TMDL documents in the body of the Integrated List as well as in Appendix 1.

Category 4b was proposed by the EPA to list waters for which other pollution control requirements are expected to attain all designated uses through pollution control measures other than TMDLs. Massachusetts' attempt to use this category in 2004 to list lakes and ponds impaired solely by mercury deriving from atmospheric deposition was disapproved by the EPA (see Fish Consumption Advisories later in this section). Massachusetts is not including any waters in Category 4b for the 2008 listing cycle.

The CWA distinguishes between "pollutants" such as nutrients, metals, pesticides, solids and pathogens that all require TMDLs and "pollution" such as low flow, habitat alterations or non-native species infestations that do not require TMDLs. Waterbodies impaired by "pollution" were included in Category 4c. The restoration of these waters will require measures other than TMDL development and implementation. Non-pollutant stressors are marked with an asterisk in the Integrated List to distinguish them from pollutants requiring TMDLs.

List Category 5 – The 303(d) List of Impaired Waters

While the EPA guidance provides the overall framework for a five-part list of waters, the development, submittal, and review of Category 5 remains subject to the prevailing regulation governing the implementation of Section 303(d) of the CWA. This regulation requires states to identify and list those waterbodies that are not expected to meet surface water quality standards after the implementation of technology-based controls and, as such, require the development of TMDLs. States must include on the lists the specific cause(s) of the impairment (if known). Finally, guidance pertaining to Section 303(d) is clear with respect to the removal of waterbodies from the list. Waterbodies or applicable segments thereof can be removed when a TMDL is approved by the EPA for that waterbody or segment (note that these waters are now listed in Category 4a until it is determined that they are no longer impaired). In addition, there are some instances when a previously listed waterbody can be removed from the 303(d) List without calculating a TMDL. These are: 1) when a new assessment reveals that the waterbody is now meeting all applicable water quality standards or is expected to meet those standards in a reasonable timeframe as the result of implementation of required pollution controls; and 2) when, upon re-examination, the original basis for listing is determined to be flawed.

In preparing 303(d) lists States are required to assemble and evaluate all existing and readily available data, including but not limited to the most recent 305(b) report and 319 nonpoint source assessment December, 2008 (2)

report, dilution calculations or predictive simulation models, and reports by government agencies, members of the public, or academic institutions. When preparing individual watershed assessment reports the MassDEP relies on these and additional information sources as described earlier in this document. In turn, these reports provide the documentation for the assignment of each waterbody to the appropriate Integrated List category. The development of the 2008 Category 5 (i.e., 303d) list began with a review of Category 5 waters contained in the 2006 List as well as the six watershed assessment reports completed since the 2006 list was published. Previously unlisted waterbodies that were determined to be impaired for one or more uses because of pollutants (see below) were added to the 2008 303(d) list. Waters listed in Category 5 on the 2006 303(d) List, for which no new assessment was made, were retained in Category 5 of the 2008 Integrated List.

Waters were listed in Category 5 if they were identified as impaired (i.e., not supporting one or more intended use), the impairment was related to the presence of one or more "pollutants", and the source of those pollutants was not considered to be natural. In most instances, finding an impaired waterbody during the watershed assessment process led directly to its assignment to Category 5. Nonetheless, some differences do exist between the assessment reports and the 303(d) list. For example, segments for which incomplete or anecdotal information suggests the possibility of use impairment are assigned "alert status" in the watershed assessment reports so that they may be targeted for monitoring and follow-up assessments during the next round of the watershed cycle. However, these segments are not listed as impaired on the 303(d) list because the MassDEP believes there is insufficient data to support listing decisions.

Biological Assessments

When determining the extent to which waterbodies are supporting aquatic life, as designated in the Water Quality Standards, the MassDEP often relies on the results of biological surveys, with or without supplemental physico-chemical analyses. Macroinvertebrate, fish and periphyton (i.e., attached algae) communities, often in combination, are typically used for making this assessment. While these community assessments are invaluable for determining use impairment, they often do not provide insight pertaining to the cause or source of the apparent disturbance and, therefore, may not implicate "pollution" or "pollutants" as contributing factors. Nonetheless, the EPA guidance is clear with regard to the use of biological assessments for listing in Category 5 and, in most instances, the MassDEP lists those waters that exhibit impaired aquatic communities.

The MassDEP prefers to make aquatic life use determinations based on an assessment of more than one community, and waters exhibiting impaired fish and invertebrate communities, for example, are strong candidates for listing in Category 5. Nonetheless, an assessment based on a single community may also result in a decision that the aquatic life use is not supported. This depends, in part, on whether the assessment relies on a screening level of effort or a more intensive analysis. For example, the EPA Rapid Biomonitoring Protocol (RBP) II is a screening-level investigation that relies on family-level macroinvertebrate community data to place a given site in one of three impairment categories. Determinations of "no impairment" or "severe impairment" with the RBP II are generally considered definitive and waters in the latter category are included on the 303(d) List. However, RBP II assessments of many waterbodies fall between these extremes into a "moderately impaired" category that encompasses a wide range in the degree of impairment exhibited by the macroinvertebrate community. In these instances, the MassDEP relies on the RBP III assessment to provide a finer level of resolution to the analysis. The RBPIII entails taxonomic identification to the genus and species level and adds a fourth impairment category (i.e., "slightly impaired"). The MassDEP has established the RBP III analysis as a minimum requirement for purposes of listing waters in Category 5 unless the RBP II assessment is definitive as discussed above, or unless the review of information on the condition of additional communities, such as fish or benthic algae, results in a conclusive assessment.

Fish Consumption Advisories

The EPA provides guidance pertaining to the use of fish and shellfish consumption advisories when making 303(d)-listing decisions. In short, the EPA considers a fish-consumption advisory as evidence that the fish consumption use is not supported when the advisory is based on actual fish tissue data and those data are collected from the specific waterbody in question. To date, the Massachusetts Department of

Public Health (DPH) has issued advisories pertaining to the presence of mercury, PCBs, PAHs, DDT and other contaminants in freshwater fish. A list of DPH site-specific fish consumption advisories can be found at <http://db.state.ma.us/dph/fishadvisory/>. Waters subject to site-specific advisories, based on actual fish tissue analyses from those waters, are included on the 303(d) list. In 1994, the DPH issued a statewide consumption advisory due to widespread mercury contamination found in freshwater fish. This advisory was further revised in 2001. Because the statewide advisory encompasses all fresh waters, these waters cannot be considered as "fully supporting" the fish consumption use.

Waters Impaired by Mercury

Waters covered by the statewide advisory, as well as site-specific mercury advisories, may be impaired by local sources of mercury or by atmospheric deposition from near- and far-field sources, or both. Despite the complexities of mercury contamination, Massachusetts, along with other northeastern states, has taken a lead role in reducing mercury pollution. In 1998 the *New England Governors and Eastern Canadian Premiers Mercury Action Plan* (NEG-ECP MAP) was adopted by the region's governors and premiers. This plan called for comprehensive actions aimed at eliminating mercury releases to the environment that transcended traditional programmatic and political boundaries. In 2000 Massachusetts adopted a *Zero Mercury Strategy* to further the goals of the NEG-ECP MAP and to add the elimination of the use of mercury as a goal.

In 2004 the MassDEP noticed for public review and comment a document entitled *A TMDL Alternative Regulatory Pathway Proposal for the Management of Selected Mercury-Impaired Waters* (CN 176.0). This proposal, prepared as a supplement to the *Massachusetts Year 2004 Integrated List of Waters*, asserted that a combination of federal, regional and state controls on mercury was the most effective means of remediating the mercury impairment to air-impacted waters and that Massachusetts was effectively implementing a comprehensive plan to address in-state mercury sources. Therefore, the establishment of waterbody-specific TMDLs using the traditional approach was not considered to be a wise use of resources, and would not effectively address the problem. Thus, 90 lakes and ponds impaired solely by the atmospheric deposition of mercury were removed from Category 5 (i.e., the 303d List) and placed in Category 4b (i.e., impaired, but not requiring a TMDL) of the *Massachusetts Year 2004 Integrated List of Waters*. In June, 2006 the EPA partially approved and partially disapproved the Massachusetts 2004 303(d) List of Impaired Waters (i.e., Category 5 of the Integrated List of Waters). Specifically, the EPA disapproved Massachusetts' decision not to list the lakes and ponds impaired by atmospheric deposition as outlined in the alternative pathway document. In their review document the EPA indicated their intent, following public review and comment, to add the 90 lakes and ponds to the Massachusetts 303(d) list as impaired by mercury. As a result, the use of Category 4b was discontinued and all waters for which site-specific mercury health advisories were in force appeared in Category 5 of the *Massachusetts Year 2006 Integrated List of Waters*.

With the return to the 303(d) List of the lakes and ponds impaired solely by the atmospheric deposition of mercury, MassDEP embarked on a collaborative effort with the five other New England states, New York and the New England Interstate Water Pollution Control Commission to develop a regional TMDL for mercury. This effort resulted in a strategy for reducing mercury concentrations in fish from Northeast waterbodies so that water quality standards can be met. The strategy calls for mercury reductions at sources within the Northeast region, in states outside of the region and from outside of the United States. In the Northeast, the majority of mercury pollution derives from atmospheric deposition. Therefore, the regional TMDL is based primarily on reducing atmospheric mercury by lowering anthropogenic mercury emissions. The *Northeast Regional Mercury Total Maximum Daily Load* can be accessed at <http://mass.gov/dep/water/resources/tmdls.htm#multis>. Following a public information meeting on April 11, 2007 and subsequent 60-day public review period, the regional mercury TMDL was submitted to the EPA on October 24, 2007. The EPA approved the TMDL on December 20, 2007, and the affected lakes and ponds were moved to Category 4a (i.e., "waterbody impaired, but requisite TMDL is completed and approved") of the proposed 2008 Integrated List unless they exhibited additional impairments.

Predictive Models and Evaluated Information

The EPA guidelines specify the kinds of data and information that should be used when making decisions to list waters in Category 5, and this information is not restricted to direct observations (i.e., monitoring data).

Rather, waters should be included in Category 5 if evaluations such as dilution calculations or predictive simulation models forecast non-attainment of water quality standards. During the 1970s and 1980s the MassDEP used steady-state, low-flow stream models to calculate waste load allocations (WLA) for point discharges. Aimed primarily at reducing instream biochemical oxygen demand (BOD) and ammonia loads, the WLA were adopted in 303(e) basin plans and incorporated in individual NPDES wastewater discharge permits. As a result, advanced secondary or advanced waste treatment were implemented where necessary across Massachusetts and only occasional reviews are now needed to assess the adequacy of existing treatment in light of anticipated increases in wastewater flows. Because of the complex and site-specific nature of remaining water quality problems (e.g., nutrients, toxicants, etc.) predictive models have limited value in identifying impaired waters. In fact most modeling is now carried out for waters where impairments have already been confirmed by actual water quality or biomonitoring data. Nonetheless, predictive models continue to be utilized in combination with actual field data to fully assess water quality conditions and to derive acceptable pollutant loadings from point and nonpoint sources. Model results are considered in the 303(d) listing process in cases where those models forecast unconfirmed water quality problems. For example, when making assessment and listing decisions waters subjected to combined sewer overflows (CSO) are projected to violate standards even though confirmatory field data may be unavailable.

Shared Waters

The EPA encourages states with shared waterbodies to collaborate with one another in the development of their Integrated Lists in an attempt to make assessments for those waters as consistent as possible. Many factors can contribute to discrepancies in the use attainment determinations rendered by neighboring states for the same waters. States may vary with respect to the specific goals set forth for those waters in their respective SWQS. Furthermore, differing Assessment and Listing Methodologies, or even asynchronous rotating watershed assessment schedules may lead to assessment and listing inconsistencies between states. Prior to making individual watershed assessments the MassDEP attempts to gather all existing and readily available data and information from as many sources as possible. This includes reviewing the most recent 305(b) reports and other applicable data and information from adjacent states. Nonetheless, discrepancies often do exist for the reasons cited above.

Prioritizing Waters for TMDL Development

A key component of the 303(d) listing process is establishing timelines for TMDL development. It is recommended in EPA guidance "that States develop a schedule for establishing TMDLs as expeditiously as practicable." More specifically states must identify which TMDLs will be developed in each of the two years leading up to the next listing (i.e., 2010), and the approximate number of TMDLs to be derived for each year thereafter. Furthermore "States need not specifically identify each TMDL as high, medium or low priority. Instead the schedule itself can reflect the State's priority ranking." The TMDL schedule is intended to communicate the State's priorities to the public and the EPA and to assist with the allocation of resources to the TMDL development effort. As such the schedule is not subject to approval by the EPA. Details pertaining to the status of TMDL development in Massachusetts, including detailed work plans, can be found under "Restore Degraded Water Quality" at <http://www.mass.gov/dep/water/priorities/sggwhome.htm#restore>.

To set priorities for TMDL development the MassDEP evaluates the causes and locations of impairments across the state using the most recent version of the 303(d) List of Impaired Waters for which this information has been summarized. Because the EPA only recently approved the 2006 List, the 2004 Integrated List defined the priorities implicit in the current TMDL schedule. Summary information from the 2004 submittal indicates that the major causes of surface water impairment in Massachusetts are excess nutrients and pathogens. Therefore, the MassDEP has placed a high priority on developing TMDLs for these pollutants in the coming years.

A TMDL schedule that reflects Massachusetts' priorities is explicitly outlined in the FY08-09 Work Plan for the MassDEP's Bureau of Resource Protection (see updated table below). For example, the MassDEP has partnered with the UMass-Dartmouth School of Marine Science and Technology (SMAST) to assess nutrient-impaired coastal waters in southeastern Massachusetts and to derive TMDLs for 89 embayments over the next several years. To date, this effort has resulted in the development of nitrogen TMDLs for 33 major embayments for waters in the Buzzards Bay and Cape Cod drainage systems. (See information

pertaining to the Massachusetts Estuaries Project (MEP) at [http://mass.gov/dep/water/resources/coastalr.htm.\)](http://mass.gov/dep/water/resources/coastalr.htm.)

During FY06 MassDEP worked closely with the EPA Region 1 to draft "bundled" bacteria TMDLs and clean up plans for impaired waters in all 27 watersheds in Massachusetts. Although the original goal was to complete half of those TMDLs in FY06 and FY07, this effort was delayed by an unrelated court decision that necessitated a major revision to the initial approach. During FY07 MassDEP received approval of the first watershed-wide bacteria TMDL for 20 segments in the Charles River Watershed. The plan for FY08 is to revise and complete these clean up plans (based on best available data) for approximately half of Massachusetts' watersheds and to provide general implementation guidance based on different types of land use activities. TMDLs for the remaining watersheds will be completed in FY09. Upon completion, these plans will address over 350 water bodies currently impaired due to bacteria contamination.

² Data collection and technical analysis indicated impairment was naturally occurring and therefore no need for a TMDL.

³ Pending contract renegotiation

In addition to completing the TMDLs listed above, the MassDEP will place a high priority on several other TMDL-related projects in FY08-10. These are listed in the table below. Many of these projects are collaborative efforts with such partners as the EPA, U. S. Geological Survey (USGS), U. S. Army Corps of Engineers (USACOE), New England Interstate Water Pollution Control Commission (NEIWPCC), consulting engineers and scientists, and non-governmental organizations. And, while some of these projects entail the actual derivation of new TMDLs, others focus on the implementation of approved TMDLs.

Ongoing TMDL-related projects receiving high priority for FY08-10

Waterbody	Pollutant/Issue	TMDL Involvement/ Status	Coordinator(s)

Category 1 Waters

“Waters Attaining All Designated Uses”

Massachusetts is currently listing no waters in this category due to the issuance by the Massachusetts Department of Public Health of a state-wide health advisory pertaining to the consumption of finfish. This advisory precludes any waters from being in full support of the fish consumption use. More information pertaining to fish consumption advisories and the assessment of the fish consumption use can be found in the Assessment and Listing Methodology section of this report.

Lymans Pond (72070)	MA72070_2006	5	5	"Non-Native Aquatic Plants" added based on new assessment
Mill River (7240025)	MA72-15_2006	2	5	Added to category 5 ("Temperature, water") based on new assessment
Mine Brook (7240200)	MA72-14_2006	5	5	Now includes Mine Brook Pond. "Cause Unknown" removed; "Temperature, water" added based on new assessment
Muddy River (7239075)	MA72-11_2006	5	5	"Turbidity" and "Non-Native Aquatic Plants" added based on new assessment
Lake Pearl (72092)	MA72092_2006	4c	5	Added to Category 5 ("Oxygen, Dissolved") based on new assessment
Populatic Pond (72096)	MA72096_2006	5	5	"Oxygen, Dissolved", "Dissolved oxygen saturation" added based on new assessment.
Powissett Brook (7239525)	MA72-20_2006	2	5	Added to Category 5 ("Combined Biota/Habitat Bioassessments") based on new assessment
Rock Meadow Brook (7239500)	MA72-21_2006	5	5	"Nutrient/Eutrophication Biological Indicators", "Aquatic Macroinvertebrate Bioassessments", "Oxygen, Dissolved", "Phosphorus (Total)", "Excess Algal Growth", "Aquatic Plants (Macrophytes)" added; "Pathogens" removed based on new assessment
Sawmill Brook (7239400)	MA72-23_2006	5	5	"Phosphorus (Total)" added; "Other habitat alterations", "Taste, odor, color" removed based on new assessment
South Meadow Brook (7239375)	MA72-24_2006	5	5	"Debris/Floating/Trash" added; "Taste, odor, color" removed based on new assessment
Stop River (7239925)	MA72-10_2006	5	5	"Temperature, water" added based on new assessment
Trout Brook (7239575)	MA72-19_2006	5	5	"Temperature, water" added based on new assessment
Uncas Pond (72122)	MA72122_2006	3	5	Added to Category 5 ("Oxygen, Dissolved", "Non-Native Aquatic Plants") based on new assessment
Unnamed Tributary (7239055)	MA72-31_2006	5	5	"Sedimentation/Siltation", "Bottom Deposits", "Foam/Flocs/Scum/Oil Slicks" added based on new assessment

Appendix 3

Category 5 and 4c Impairments added to the 2008 Integrated List

Unnamed Tributary (7239080)	MA72-30_2006	5	5	"Total Suspended Solids" added; "Cause unknown", "Organic enrichment/low DO" removed based on new assessment
Waban Brook (7239600)	MA72-17_2006	2	5	Added to Category 5 ("Temperature, water") based on new assessment
Lake Winthrop (72140)	MA72140_2006	5	5	"Aquatic Plants (Macrophytes)" added based on new assessment
Connecticut				
Bloody Brook (3420150)	MA34-36	--	5	New segment – Added to Category 5 ("Oxygen, Dissolved", "Phosphorus (Total)", "Turbidity", "Escherichia coli") based on new assessment
Fort River (3419425)	MA34-27_2006	3	5	Added to Category 5 ("Escherichia coli") based on new assessment
Manhan River (3418175)	MA34-11_2006	3	5	Added to Category 5 ("Escherichia coli") based on new assessment
Mill River (3417625)	MA34-29_2006	3	5	Added to Category 5 ("Escherichia coli") based on new assessment
Mill River (3418825)	MA34-28_2006	3	5	Added to Category 5 ("Escherichia coli") based on new assessment
Mill River (3420175)	MA34-25_2006	3	5	Added to Category 5 ("Escherichia coli") based on new assessment
Nashawannuck Pond (34057)	MA34057_2006	5	5	"Non-Native Aquatic Plants" added based on new assessment
Oxbow (34066)	MA34066_2006	5	5	"Non-Native Aquatic Plants" added based on new assessment
Stony Brook (3417925)	MA34-19_2006	3	5	Now includes Upper Pond and Lower Pond. Added to Category 5 ("Aquatic Plants (Macrophytes)", "Non-Native Aquatic Plants", "Eurasian Water Milfoil", "Escherichia coli", "Turbidity") based on new assessment
Wilton Brook (3418250)	MA34-15_2006	3	5	Now includes Rubber Thread Pond ("Aquatic Plants (Macrophytes)"). "Non-Native Aquatic plants" added based on new assessment.
Hoosic				
Cheshire Reservoir (11019)	MA11019_2006	4c	5	Added to Category 5 ("Excess Algal Growth", "Non-Native Aquatic Plants", "Eurasian Water Milfoil") based on new assessment
Hoosic River (1100500)	MA11-03_2006	5	5	"Cause Unknown" removed and "Ambient Bioassays – Chronic Aquatic Toxicity", "Temperature, water" added based on new assessment
Mauserts Pond (11009)	MA11009	--	5	New segment – Added to Category 5 ("Enterococcus") based on new assessment
Housatonic				
Lake Buel (21014)	MA21014_2006	5	5	"Oxygen, Dissolved", "Dissolved oxygen saturation" added based on new assessment
East Branch Housatonic River (2105275)	MA21-01_2006	5	5	"Fecal Coliform" added based on new assessment
Lake Garfield (21040)	MA21040_2006	2	5	Added to Category 5 ("Eurasian Water Milfoil", "Non-Native Aquatic Plants", "Phosphorus (Total)", "Oxygen, Dissolved") based on new assessment
Housatonic River (2103450)	MA21-04_2006	5	5	"Turbidity" removed and "Non-native Aquatic Plants" added based on new assessment. (<i>Trapa natans</i>)
Housatonic River (2103450)	MA21-19_2006	5	5	"Thermal modifications", "Turbidity", "Whole Effluent Toxicity (WET)", "Ambient Bioassays – Acute Aquatic Toxicity", and "Pathogens" removed; "Excess Algal Growth", and "Phosphorus (Total)" added based on new assessment
Hubbard Brook (2103750)	MA21-15_2006	5	4c	"Pathogens" removed and "Eurasian Water Milfoil" and "Non-Native Aquatic Plants" added based on new assessment.
Laurel Lake (21057)	MA21057_2006	4c	5	Added to Category 5 ("Phosphorus (Total)", "Oxygen, Dissolved", "Dissolved oxygen saturation") based on new assessment
Southwest Branch Housatonic River (2106025)	MA21-17_2006	5	5	"Cause Unknown", and "Other habitat alterations" removed; and "Fecal Coliform" added based on new assessment.

Category 5 and 4c Impairments added to the 2008 Integrated List

Wahconah Falls Brook (2105400)	MA21-11_2006	3	5	Added to Category 5 ("Fecal Coliform") based on new assessment
West Branch Housatonic River (2105775)	MA21-18_2006	5	5	"Debris/Floatables/Trash" and "Odors" added and "Sedimentation/Siltation" removed based on new assessment
North Coastal				
Alewife Brook (9354725)	MA93-45	--	5	New segment – Added to Category 5 ("Fecal Coliform") based on new assessment
Alewife Brook (9354725)	MA93-46	--	5	New segment – Added to Category 5 ("Fecal Coliform") based on new assessment
Bass River (9355175)	MA93-07_2006	3	5	Now includes Shoe Pond. Added to Category 5 ("Fish-Passage Barrier", "Turbidity") based on new assessment
Bennetts Pond Brook (9355625)	MA93-48	--	5	New segment – Added to Category 5 ("Fecal Coliform") based on new assessment
Causeway Brook (9355075)	MA93-47	--	5	New segment – Added to Category 5 ("Fecal Coliform") based on new assessment
Gloucester Harbor (93903)	MA93-18_2006	5	5	"Oxygen, Dissolved", "Combined Biota/Habitat Bioassessment" added based on new assessment
Pillings Pond (93056)	MA93056_2006	5	5	"Non-Native Plants", "Oxygen, Dissolved", "Chlorophyll-a" and "Phosphorus (Total)" added based on new assessment
Proctor Brook (9355400)	MA93-40_2006	5	5	"Debris/Floatables/Trash", "Foam/Flocs/Scum/Oils Slicks" and "Odors" added based on new assessment
Salem Harbor (93906)	MA93-21_2006	5	5	"Estuarine Bioassessments" added based on new assessment
Shute Brook (9355575)	MA93-50	--	5	New segment – Added to Category 5 ("Fecal Coliform") based on new assessment
Shute Brook (9355575)	MA93-49	--	5	New segment – Added to Category 5 ("Fecal Coliform") based on new assessment
Unnamed Tributary	MA93-51	--	5	New segment – Added to Category 5 ("Fecal Coliform", "Alteration in stream-side or littoral vegetative covers", "Other flow regime alterations", "Physical substrate habitat alterations", "Debris/Floatables/Trash", "Odors") based on new assessment
Ten Mile				
Fourmile Brook (5233700)	MA52-10_2006	2	5	Added to Category 5 ("Sedimentation/Siltation") based on new assessment
Miscellaneous Watersheds				
<i>Blackstone</i>				
Rice City Pond (51131)	MA51131_2006	5	5	"Pesticides" added based on DPH fish consumption advisory
<i>Buzzards Bay</i>				
Aucoot Creek	MA95-72	--	5	New segment – Added to Category 5 ("Nitrogen (Total)", "Oxygen, Dissolved", "Nutrient/Eutrophication Biological Indicators", "Fecal Coliform") based on comment from Buzzards Bay Coalition
"Inner" Aucoot Cove	MA95-71	--	5	New segment – Added to Category 5 ("Nitrogen (Total)", "Oxygen, Dissolved", "Nutrient/Eutrophication Biological Indicators", "Fecal Coliform") based on comment from Buzzards Bay Coalition
"Inner" Sippican Harbor	MA95-70	--	5	New segment – Added to Category 5 ("Nitrogen (Total)", "Nutrient/Eutrophication Biological Indicators", "Fecal Coliform", "Other Habitat Alterations") based on comment from Buzzards Bay Coalition
Phinneys Harbor	MA95-15	5	5	"Nitrogen (Total)", "Estuarine bioassessments" added based on MEP assessment and public comment
Wild Harbor River	MA95-68	--	5	New segment – Added to Category 5 ("Nutrient/Eutrophication Biological Indicators", "Fecal Coliform") based on comment from Buzzards Bay Coalition
<i>Cape Cod</i>				
Centerville River (9662575)	MA96-04_2006	5	5	"Nutrients" added as part of the TMDL process - TMDL approved
Perch Pond (96921)	MA96-53_2006	5	5	"Nutrients" added as part of the TMDL process - TMDL approved

Appendix 3

Category 5 and 4c Impairments added to the 2008 Integrated List

Ryder Pond, Truro	MA96268	5	5	"Metals" added based on DPH fish consumption advisory. Covered by NE mercury TMDL.
<i>French</i>				
French River (4230075)	MA42-04	3	5	"Metals" added based on DPH fish consumption advisory.
<i>Merrimack</i>				
Lowell Canals	MA84A-29	--	5	New segment – "Metals", "Priority organics", Pesticides" added based on DPH fish consumption advisory.
<i>Mystic (Boston Harbor)</i>				
Malden River (7138200)	MA71-05	5	5	"Priority organics", "Pesticides" added based on DPH fish consumption advisory
Mystic River (7138150)	MA71-02	5	5	"Priority organics", "Pesticides" added based on DPH fish consumption advisory
<i>South Coastal</i>				
Jones River (9457650)	MA94-12_2006	3	5	"Oxygen, Dissolved", "Turbidity", Excess Algal Growth", Aquatic plants (Macrophytes)", "(low flow alterations*)", "(Fish Passage Barrier*)"

303(d) Impairments and Segments removed from the 2008 Integrated List

North Branch Hoosic River (1100925)	MA11-01_2006	5	2	"Siltation" and "Pathogens" removed based on new assessment. Aquatic life, primary and secondary contact recreation and aesthetic uses met
North Branch Hoosic River (1100925)	MA11-02_2006	5	5	"Siltation" and "Suspended solids" removed based on new assessment
Paull Brook (1100850)	MA11-20_2006	5	5	"Other inorganics", "Nutrients", "Oil and grease" removed based on new assessment and flawed original listing
South Brook (1101475)	MA11-15_2006	5	2	"Pathogens" removed based on new assessment. Aquatic life, primary and secondary contact recreation and aesthetic uses met
West Branch Green River (1100725)	MA11-22_2006	5	2	"Cause Unknown", "Organic enrichment/Low DO" removed based on new assessment. Aquatic life, primary and secondary contact recreation and aesthetic uses met

Housatonic

East Branch Housatonic River (2105275)	MA21-02_2006	5	5	"Cause Unknown" and "Unknown toxicity" removed based on new assessment.
Goose Pond Brook (2104775)	MA21-07_2006	5	2	"Pathogens" removed based on new assessment. Aquatic life, primary and secondary contact recreation and aesthetic uses met
Housatonic River (2103450)	MA21-04_2006	5	5	"Turbidity" removed and "Non-native Aquatic Plants" added based on new assessment. (<i>Trapa natans</i>)
Housatonic River (2103450)	MA21-19_2006	5	5	"Thermal modifications", "Turbidity", "Whole Effluent Toxicity (WET)", "Ambient Bioassays – Acute Aquatic Toxicity", and "Pathogens" removed; "Excess Algal Growth", and "Phosphorus (Total)" added based on new assessment
Housatonic River (2103450)	MA21-20_2006	5	5	"Pathogens", "Taste, odor and color" removed based on new assessment.
Hubbard Brook (2103750)	MA21-15_2006	5	4c	"Pathogens" removed and "Eurasian Water Milfoil" and "Non-Native Aquatic Plants" added based on new assessment.
Konkapot River (2103525)	MA21-26_2006	5	5	"Organic enrichment/Low DO" and "Pathogens" removed based on new assessment
Southwest Branch Housatonic River (2106025)	MA21-17_2006	5	5	"Cause Unknown", and "Other habitat alterations" removed; and "Fecal Coliform" added based on new assessment.
West Branch Housatonic River (2105775)	MA21-18_2006	5	5	"Debris/Floatables/Trash" and "Odors" added and "Sedimentation/Siltation" removed based on new assessment

North Coastal

Beaver Brook (9355300)	MA93-37_2006	5	5	"Pathogens" removed based on new assessment
Chebacco Lake (93014)	MA93014_2006	5	4c	Northeast mercury TMDL approved
Coy Pond (93016)	MA93016_2006	5	2	"Noxious aquatic plants" and "Turbidity" removed based on new assessment – Aesthetic use met
Crane Brook (9355325)	MA93-02_2006	5	5	"Unionized Ammonia", "Organic enrichment/Low DO", "Other habitat alterations", "Suspended solids" and "Turbidity" removed based on new assessment
Crane River (9355275)	MA93-38_2006	5	2	"Pathogens" and "Turbidity" removed based on new assessment
Forest River (9355500)	MA93-10_2006	5	5	"Pathogens" removed based on new assessment. "Flow alteration" and "Other habitat alterations" were never linked to impairment so were erroneously listed.
Goldthwait Brook (9355450)	MA93-05_2006	5	5	"Unknown toxicity", "Unionized ammonia", "Cause unknown" and "Noxious aquatic plants" removed based on new assessment
Porter River (9355225)	MA93-04_2006	5	5	"Siltation", "Noxious aquatic plants" and "Turbidity" removed based on new assessment
Saugus River (9355550)	MA93-35_2006	5	5	"Organic enrichment/Low DO" removed based on new assessment
Waters River (9355350)	MA93-01_2006	5	5	"Other habitat alterations" removed based on new assessment

Ten Mile

Cargill Pond (52004)	MA52004_2006	5	5	"Noxious aquatic plants" removed – no excess algae or macrophytes that exhibit blooming conditions – should have been removed as part of original aquatic plant de-listing effort in 2002 and 2004
